

Designing All Electric Ships

CAPT Norbert Doerry Howard Fireman Naval Sea Systems Command

Ann Arbor, Michigan May 16 - 19, 2006

May 16-19, 2006

AGENDA

- Integrated Power System (IPS) Introduction
- IPS Design Opportunities
- IPS Design Considerations
- IPS Design Watch Items
- Conclusions
 - The Integrated Power System provides the naval architect with many opportunities to optimize ship design.
 - It's important that the Naval Architect take advantage of these opportunities, otherwise a sub-optimized IPS ship design may not outperform an optimized conventional mechanical drive ship design.
 - Improving the efficiency of prime movers and propulsors (along with drag reduction) can compensate for lower transmission efficiency of electric drive.

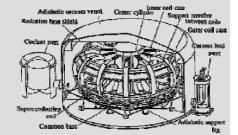

Integrated Power System (IPS)

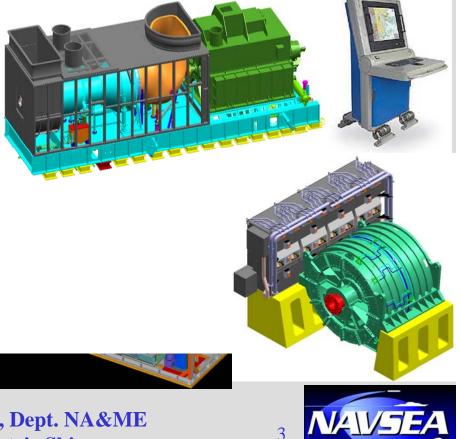

IPS consists of an architecture and a set of modules which together provide the basis for designing, procuring, and supporting marine power systems applicable over a broad range of ship types:

- Power Generation Module (PGM)
- Propulsion Motor Module (PMM)
- Power Distribution Module (PDM)
- Power Conversion Module (PCM)
- Power Control (PCON)
- Energy Storage Module (ESM)
- Load (PLM)

SYSTEMS COMMAN

May 16-19, 2006

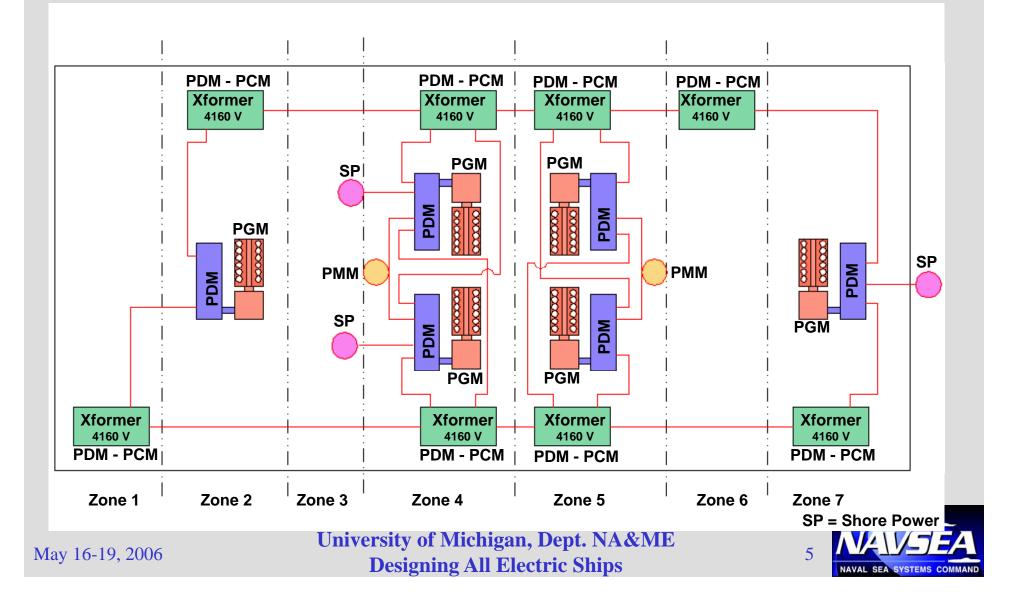

IPS Architecture

- Integrated Power
 - Propulsion and Ship Service Loads provided power from same prime movers
- Zonal Distribution
 - Longitudinal Distribution buses connect prime movers to loads via zonal distribution nodes (switchboards or load centers).

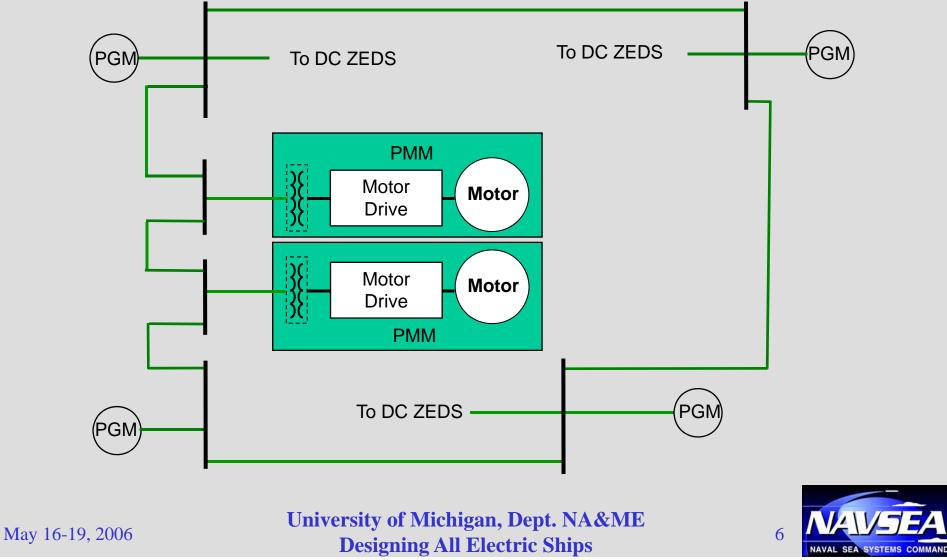

IPS: Medium Voltage AC Design

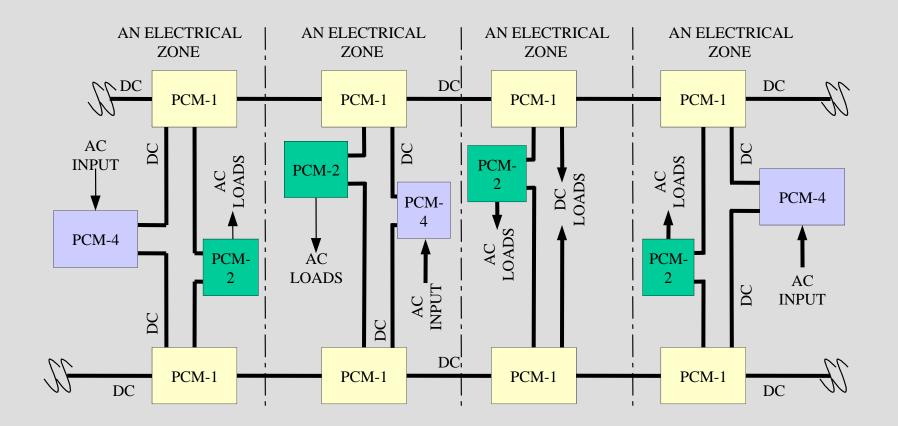

IPS with DC Zonal Electrical Distribution: Medium Voltage AC Distribution System

DC Zonal Electrical Distribution System

University of Michigan, Dept. NA&ME Designing All Electric Ships

May 16-19, 2006

IPS Design Opportunities

- Support High Power Mission Systems
- Reduce Number of Prime Movers
- Improve System Efficiency
- Provide General Arrangements Flexibility
- Improve Ship Producibility
- Support Zonal Survivability
- Facilitate Fuel Cell Integration

Support High Power Mission Systems

High Powered Sensor Combination Sensor and Weapon High Powered Microwave High Powered Laser Organic Surveillance Drone High Altitude Beam Power to Aircraft Minimal Handling - No Refueling

Electromagnetic Gun More than 10 MJ on Target Megawatt Range

High Energy Laser

Enhanced Self Defense Precision Engagement No Collateral Damage Megawatt Class Laser

NO ENERGETICS ABOARD SHIP!

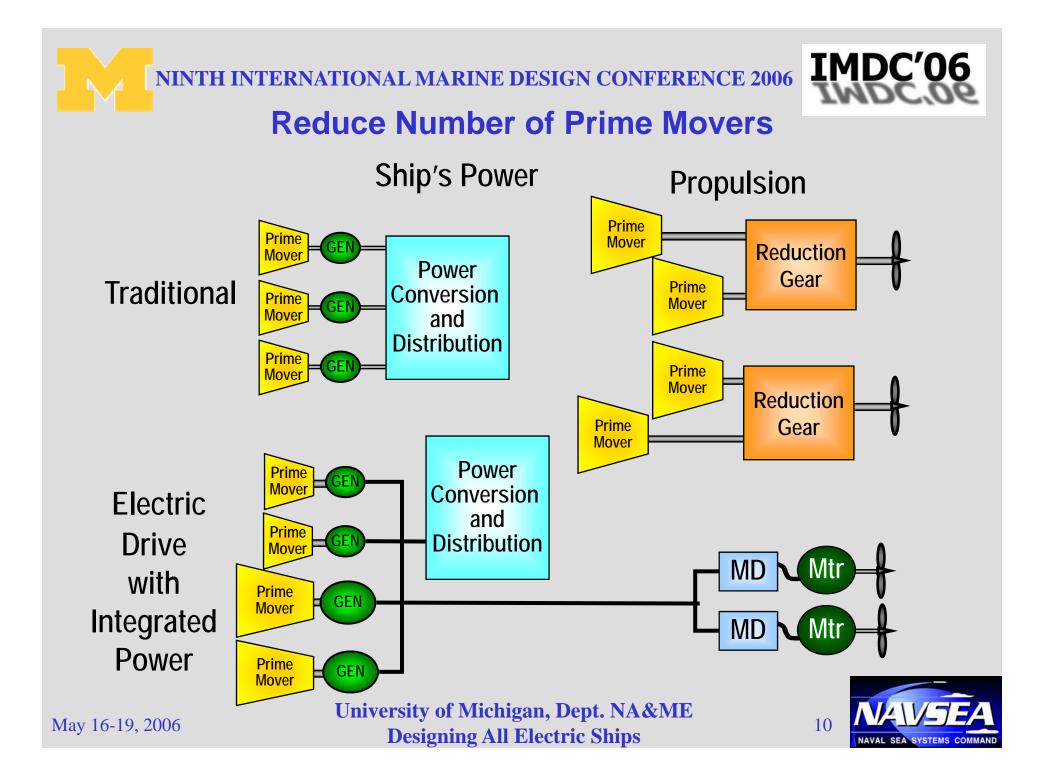

Integrated Power System Affordable Power for Weapons and Propulsion Power Dense, Fuel Efficient Propulsion Reduced Signatures Power Conversion Flexibility

All Electric Auxiliaries No Hydraulics No HP Gas Systems Reduced Sailor Workload

University of Michigan, Dept. NA&ME Designing All Electric Ships

May 16-19, 2006

Improve System Efficiency

- A generator, motor drive and motor will generally be less efficient than a reduction gear
- But electric drive enables the prime mover and propulsor to be more efficient, as well as reducing drag.

	Mechanical Drive	Electric Drive
Gas Turbine	30%	35%
Reduction Gear	99%	
Generator		96%
Drive		95%
Motor		98%
Propeller	70%	75%
Relative Drag Coefficient	100%	97%
Total	21%	24%
Ratio		116%

Representative values: not universally true

TRADE TRANSMISSION EFFICIENCY TO REDUCE DRAG AND IMPROVE PRIME MOVER AND PROPELLER EFFICIENCY

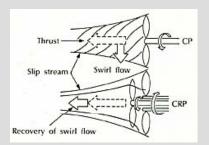

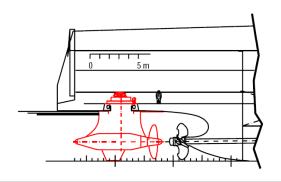

IONAL MARINE DESIGN CONFI NCE 2006

Improve System Efficiency: Contra-Rotating Propellers

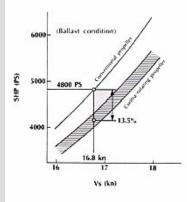

- Increased Efficiency
 - Recover Swirl Flow
 - 10 15% improvement
- Requires special bearings for inner shaft if using common shaft line
- Recent examples feature Pod for aft propeller

Anders Backlund and Jukka Kuuskoski, "The Contra Rotating Propeller (CRP)

Concept with a Podded Drive"

Diesel Mechanical System

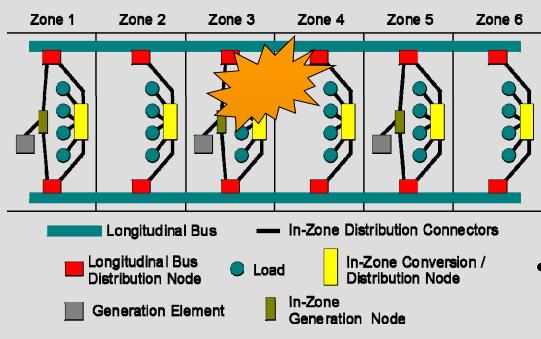

Integrated Power System

- Vertical Stacking of
 Propulsion Components
- Pods
- Athwart ship Engine Mounting
- Horizontal Engine Foundation
- Engines in Superstructure
- Distributed Propulsion
- Small Engineering
 Spaces

Support Zonal Survivability

- Zonal Survivability is the ability of a distributed system, when experiencing internal faults, to ensure loads in undamaged zones do not experience a service interruption.
 - Sometimes applied to only Vital Loads.
 - Usually requires one longitudinal bus to survive damage.
- Limits damage propagation to the fewest number of zones.
 - Enables concentration of Damage Control / Recoverability Efforts.

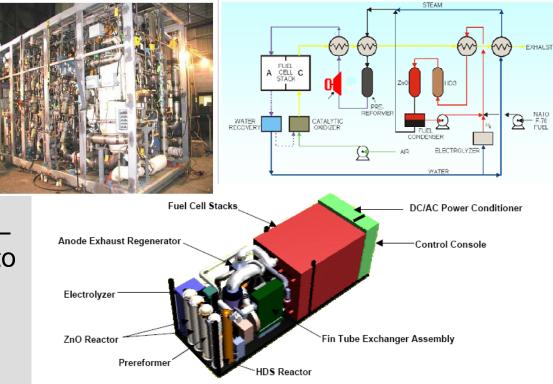

May 16-19, 2006

Facilitate Fuel Cell Integration

- Many Advantages
 - Highly Efficient (35-60%)
 - No Dedicated intakesuptakes; use ventilation
- Challenges
 - Reforming Fuel into Hydrogen – Onboard Chemical Plant.
 - Eliminating Sulfur from fuels.
 - Slow Dynamic Response Requires Energy storage to balance generation and load
 - Slow Startup Best used for base-loads

FuelCell Energy 625kW 450V, 30, 60 HZ, MC SSFC Power System

IPS Design Considerations

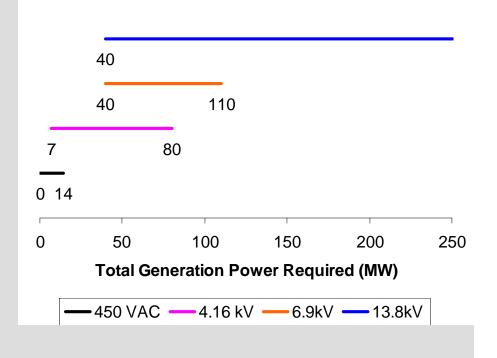

- Selection of High Voltage Bus Voltage
- Number and Type of Power Generation Modules
- Propulsion Motor Module Technology
- Propulsor Architecture
- AC or DC Zonal Electrical Distribution

Selection of High Voltage Bus Voltage

- Higher Voltages Desired
 - Circuit Breaker Rating
 - Reduced Cable Weight
 - Generator Reactance
- Lower Voltage Desired
 - Reduce risk for corona
 - Possible elimination of transformer for propulsion motor module
 - Insulation and Thermal design of Generator
- Shore Power
 - 450 V, 4.16 kV or 13.8 kV desired

Selecting the bus voltage is a compromise

Number and Type of Power Generation Modules

- Past studies have shown that 4 to 6 power generation modules generally provide the most cost effective solutions.
 - Typically have at least 2 larger "Main generators" and 2 smaller "auxiliary generators"
- Auxiliary Generators sized to be efficient between the minimum operating conditions (with 2 online) and the point where the main generators are efficient.
 - Often Diesel Generators
 - Should be self-starting
- Main Generators sized to provide maximum power requirements along with auxiliary generator sets
 - Often Gas Turbine Generators
 - An even number simplifies bus architecture
- May also need small emergency generators for dark-ship start

Propulsion Motors: General Observations

- Propulsion Motors are typically custom designed for the application based on standard "Frame Sizes".
 - Frame size determines rotor diameter.
 - Variables are length and shaft speed.
- The Motor Drive has a large impact on both the Propulsion Motor and the High Voltage Distribution System.
 - Harmonics and Power Quality
 - Part Load Efficiency
 - Number of Motor Phases
 - Need for Propulsion Transformer
- Motor Designs have changed significantly in past 15 years to take advantage of new high voltage and current power electronics.
 - Permanent Magnet (PM) and Advanced Induction Motors (AIM) have largely displaced DC and Synchronous Motors for high power applications.
 - Homopolar Motors and Superconducting Motors are still being developed.

Motors: Basic Scaling Law

$HP \propto D^2 \cdot L \cdot A \cdot B \cdot RPM$

- HP Power Rating
- D Rotor Diameter
- L Rotor Active Length
- A Surface Current Density (Conductor Material & Cooling Method)
- B Rotor Flux Density (Saturation of Magnetic Material)
- **RPM Shaft Speed**

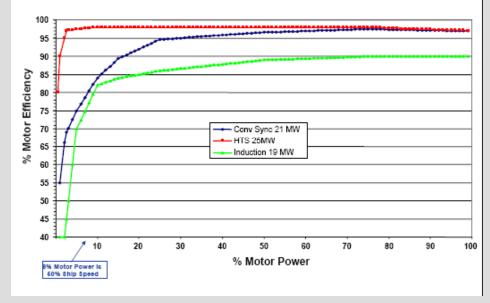

Propulsion Motor Thumb Rules

- For a given technology, cost is roughly proportional to Torque.
- Maximum Rotor Diameter is limited by shaft rake considerations, manufacturability, and transportability.
- Motor efficiencies at design power typically fall in range of 90-98%.
- Below about 15-35% rated power, the efficiency of a conventional motor drops rapidly.
 - Can be improved through advanced motor design and proper integration with motor drive

Representative Efficiency Curves

May 16-19, 2006

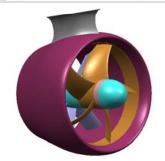

Propulsor Architecture

- Improve Efficiency
 - Fixed Pitch vs. CPP
 - Contra-rotating
 - Pods
 - Tandem Motors
- Maneuverability
 - Trainable Pods
 - Thrusters
- Survivability
 - Distributed Propulsion
- Support innovative Hull
 Design
 - SWATH
 - Multi-Hulls

AC or DC Zonal Electrical Distribution

- AC Zonal Electrical Distribution is preferred when
 - Power Quality of the high voltage bus is good enough such that ship service loads receive power meeting MIL-STD-1399 section 300A Interface standards.
 - Depends on Motor Drive Technology
 - Depends on Harmonic Filtering on high voltage bus
 - The number of un-interruptible loads is small.
- Otherwise, DC Zonal Electrical Distribution (or Integrated Fight Through Power – IFTP) is generally preferred

IPS Design Watch Items

- Part Load Efficiencies
- Dark-Ship Starts
- Shore Power
- Power Generation Module Start Time
- Component Reliability
- Common Mode Failure
- Transformer In-Rush Current

Conclusions

- The Integrated Power System provides the naval architect with many opportunities to optimize ship design.
 - It's important that the Naval Architect take advantage of these opportunities, otherwise a sub-optimized IPS ship design may not outperform an optimized conventional mechanical drive ship design.
- Improving the efficiency of prime movers and propulsors (along with drag reduction) can compensate for lower transmission efficiency of electric drive.
